

# Quantitative Face Fit Testing

Our experienced and Fit2Fit Accredited Respiratory Technicians will be carrying out face fit testing in Jersey from November onwards.

On the UK mainland it's a legal requirement for all employees who wear tight fitting RPE, to be face fit tested. We specialise in quantitative face fit testing using the TSI PortaCount machine which gives extremely accurate results and complete reassurance to any person exposed to potentially harmful environments. Quantitative testing determines the integrity of the mask and its seal against your face and scientifically proves that your mask is giving you the correct protection. The machine measures and compares the ambient air against the air inside your mask, the cleaner the air inside the mask the higher the fit factor.

The test itself takes between 20-30 minutes where each wearer will don the mask and then carry out a series of 7 exercises which are designed to mimic their everyday activities such as talking, bending over, moving their head from side to side etc.

After each exercise a pass or a fail be detected. Once all 7 exercises have passed the test, a certificate will be issued immediately.

In addition to every face fit test, we provide assistance and training on how to correctly maintain and don the RPE, thus ensuring your workforce achieve the best protection possible.

Date: November onwards

Time: Varied to suit client requirements

Venue: Testing carried out at company location

Cost: Upon request and payment upon booking required
